

Forge Platform ICP #2: Enterprise Greenfield Teams

Core hypothesis

Teams launching new products or platforms want enterprise-grade operational foundations without standing up a full internal platform engineering function first.

Typical characteristics

- New product divisions
- Platform initiatives
- Cloud-native transformation projects
- Innovation teams

Common goals

- Faster delivery
- Operational consistency
- Security by default
- Governance
- Reduced platform engineering effort

Industries

Financial services, insurance, healthcare technology, enterprise software, telecommunications, government technology, utilities.

Qualification questions

- Is this a net-new product or platform — not a lift-and-shift of a legacy monolith?
- Does leadership want standardized architecture without a multi-year internal platform build?
- Is AWS an acceptable deployment target for the initiative?

Trigger events

- New platform or product initiative approved
- New CTO or engineering leadership with a delivery mandate
- Cloud migration or modernization program underway
- Acquisition requiring engineering standardization
- Multiple platform, SRE, or cloud engineering hires

Buyer titles

Director of Engineering, VP Engineering, Head of Platform Engineering, Head of Software Engineering, Principal Architect, Enterprise Architect, Staff Engineer, Platform Architect, Cloud Architect

Core tech stack

- Java and Quarkus (JVM or GraalVM native) on AWS ECS Fargate
- Cognito, RDS PostgreSQL, DynamoDB, and S3
- Infrastructure defined in CDK; delivery via GitHub Actions
- Prometheus, Grafana, and OpenTelemetry
- Forked to the customer's GitHub org; runs in their AWS account
- AWS-only today — opinionated by design

Primary message

Standardized enterprise-grade architecture with security, governance, operational consistency, and automated delivery — available immediately rather than built internally over several years.

Conversation hooks

"Give a greenfield team the internal platform capability normally built by companies 10x their size — without standing up a platform engineering function."

"The entire operational stack behind a modern SaaS company — with security, governance, and operational consistency built in."

"Standardized architecture now, not a multi-year internal platform build."

"Most teams spend years assembling this. Forge puts a production-ready foundation in place from day one."

"Production-grade platform foundations at a fraction of the cost of building them internally."

"Founder-led deployment support — hands-on help through onboarding and first production deploy."
